## Introduction

In addition to the existing dealer channels, sales companies decided to expand by selling Kyocera printing devices through an e-commerce channel. This means that end-users must be able to install the drivers by themselves. In order to make the driver installation easy and straightforward, a new installer has been implemented.

The new installer is based on user experience research conducted by interviewing experienced and non-experienced groups of people as well as investigating competitors' drivers. As a result, the usability and installation flow has been improved in the new installer in order to make a simple and easy-to-use tool for all types of customers from SMB to enterprise.

## Product Benefits

- Easy operation for non-technical users
- Easy to set up
- Descriptive UI for error handling

# Technical Specification and Product Features

## Installation Type

The new installer gives users two options:

**Quick Installer.** This is the recommended option for SMB or home users for printer driver and Scan Tool installation. If a user chooses this option, the installer continues with the new simplified installer for Sirius and Libra printing devices.

**Custom Installer.** This option is for enterprise users who need to install software in addition to the Scan Tool. If a user chooses this option, the installer continues with the existing KMInstaller.

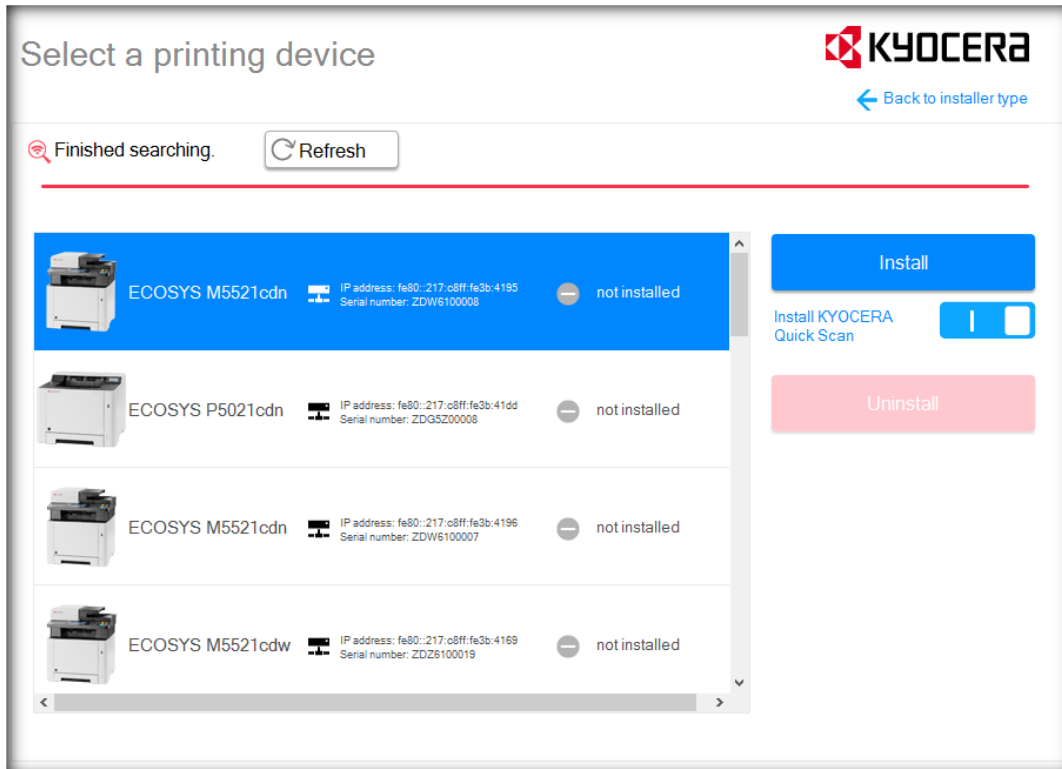

**Note:** The rest of this document describes the newly implemented Quick Installer.

## Select a Printing Device for Installation

The installer discovers all Kyocera printing devices within the network and shows the user which printing devices are already installed on the user's PC. The user can select newly discovered devices to install. Note that Status Monitor and fonts are installed silently in the background.

During the installation, users have an option to install **KYOCERA Quick Scan** at the same time and it is enabled as a default. If Quick Scan is selected, the TWAIN driver is automatically installed as well.

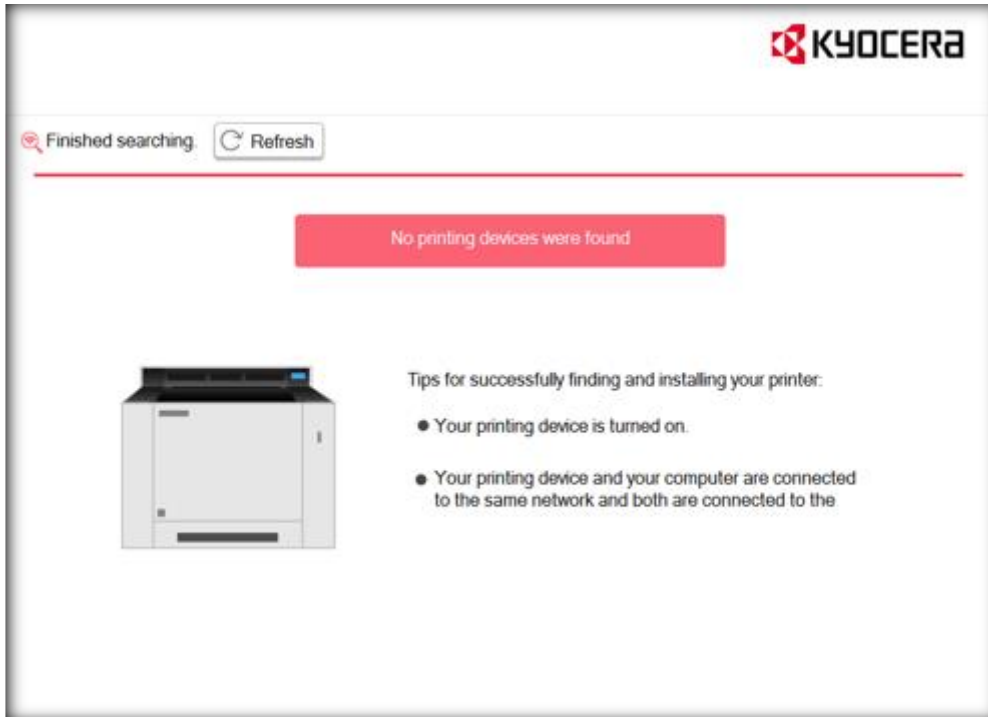

### No printing device found after discovery

If the installer did not find any printing devices, the user will get tips on how a printing device can be found successfully.

The following tips are included in the UI:

- Your printing device is turned on
- Your printing device and your computer are connected to the same network

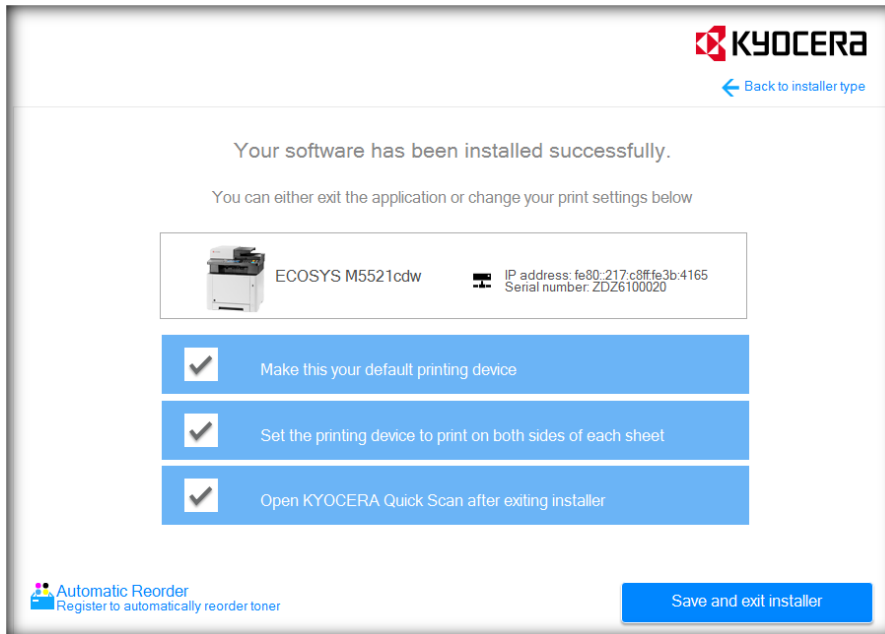

## Installation Confirmation

When the installation is complete, user has following options. All are selected as a default.

- To make the printer as a default
- To set printer to print on both sides
- To open scan tool

**Note:** The quick installer is LOT4/EPEAT-compatible. As a result, duplex printing is selected as the default setting when installing the printer driver in regions that LOT4/EPEAT is required.

**Note:** If the system locale is in Germany and the United Kingdom, in the confirmation page, the user has an option to automatically reorder toner for the installed device by registering with the KYOCERA Device Registration Tool for Amazon Dash Replenishment.

If Quick Scan is selected during the installation, after the user exits the installer, the quick scan will popup automatically.

## Supported Languages

English, French, German, Italian, Portuguese (Brasil), Portugal (Portugal), Spanish, Russian, Dutch, Japanese, Simplified Chinese, Traditional Chinese, Korean, Catalan, Danish, Finnish, Norwegian, Swedish, Greek, Hungarian, Czech, Polish, Romanian, Turkish, Arabic, Hebrew, Vietnamese, Thai

## Software Delivery

- Sirius and Libra DVD

## Application Requirements

### Prerequisite

.Net Framework 4.0 or later

### Supported Operating Systems

Windows 7, Windows 8.1, Windows 10, Windows Server 2012 and Windows Server 2016

### Screen Resolution

1024 by 768 pixels or higher

### Display DPI Setting

DPI setting other than 96 DPI is not recommended

## Supported Models
